Lab # 02

Understanding 8086 I/O Instructions and Conditional JUMP Instructions using Assembly Language in EMU8086.

Objective:

To understand the basic 8086 I/O instructions using Assembly Language Program in EMU8086.

Theory:

• 8086 Input / Output Instructions

CPU communicates with the peripherals through I/O registers called I/O ports. There are two instructions, IN and OUT, that access the port directly. These instructions are used when very fast I/O is essential; for example, in a game program. However, most applications programs do not use IN and OUT because

- i. Port addresses vary among computer models and
- ii. It's much easier to program I/O with the **service routines** provided by the manufacturer.

There are two categories of I/O service routines:

- i. The **BIOS** (Basic Input/Output System) routines.
- ii. The DOS (Disk Operating System) routines.

The BIOS routines are stored in ROM and interact directly with the I/O ports. The DOS routines carry out more complex tasks: for example, printing a character string; actually they use the BIOS routines to perform direct I/O operations.

The INT Instruction

To invoke a DOS or BIOS routine, the **INT** (interrupt) instruction is used. It has the format INT interrupt_number

Where **interrupt_number** is a number that specifies a routine. For example, **INT 16h** invokes a BIOS routine that performs keyboard input. In the following, we use a particular DOS routine, INT 21h.

INT 21h

INT 21h may be used to invoke a large number of DOS functions; a particular function is requested by placing a function number in the AH register and invoking INT 21h. Here we are interested in the following functions:

Function Number	Routine
1	single-key input
2	single-key output
9	character string output

INT 21h functions expect input values to be in certain registers and return output values in other registers. These are listed as we describe each function.

Function 1:

Single-key Input

Input: AH=1

Output: AL = ASCII code if character key is pressed = 0 if non-character key is pressed.

To invoke the routine, execute these instructions:

MOV AH, 1 ; input key function INT 21h ; ASCII code in AL

The processor will wait for the user to hit a key if necessary. If a character key is pressed, AL gets its ASCII code; the character is also displayed on the screen. If any other key is pressed, such as an arrow key, F1-F10 and so on, AL will contain 0.

Because INT 21h, function 1 doesn't prompt the user for input, he or she might not know whether the computer is waiting for input or is occupied by some computation. The next function can be used to generate an output prompt.

Function 2:

Single-key Output

Input: AH=2

DL = ASCII code of the display character or control character Output: AL = ASCII code of the display character or control character

To display a character with this function, we put its ASCII code in DL. For example, the following instructions cause a question mark to appear on the screen:

MOV AH, 2 ; display character function

MOV DL, '?'; character is '?'
INT 21h; display character

After the character is displayed, the cursor advances to the next position on the line. Function 2 may also be used to perform control functions. If DL contains the ASCII codes of a control character, INT 21h causes the control function to be performed. The principle control characters are as follows:

ASCII code	Symbol	Fucntion	
7	BEL	Beep	
8	BS	backspace	
9	HT	tab	
A	LF	line feed (new line)	
D	CR	carriage return (start of a line)	

• Conditional Control Transfer Instruction

Conditional jumps transfer control to another address depending on the values of the flags in the flag register..

The jump condition often provided by the CMP instruction:

CMP destination, source

Condition	Instruction	Condition	Instruction
Jump if zero flag ZF=1	JZ zero	Jump if zero flag ZF=0	JNZ notzero
Jump if greater	JG greater	Jump if greater than or equal	JGE notless
Jump if less	JL less	Jump if less than or equal	JLE notgreater
Jump if Below	JB smaller	Jump if carry flag CF=1	JC carry

Assembly Language Program Example:

ORG 0100h

MAIN PROC

; display prompt MOV AH, 2

MOV 711, 2 MOV DL, '?'

INT 21h

; input a character

MOV AH, 1

INT 21h

MOV BL, AL

; go to a new line with carriage return

MOV AH, 2

MOV DL, 0DH

INT 21h

MOV DL, 0AH

INT 21h

; display character

MOV DL, BL

INT 21h

; return to DOS

MOV AH, 4CH

INT 21H

MAIN ENDP

END MAIN

RET

org 100h

START: mov cl, 03h

LABEL_JNZ: dec cl

jnz LABEL JNZ

mov bl, 04h mov al, 04h

LABEL JZ: dec al

dec bl xor bl, al

jz LABEL_JZ

mov bl, 02h mov al, 06h

LABEL_JG: dec al

cmp al, bl

jg LABEL_JG mov bl, 06h mov al, 00h

LABEL JL: inc al

cmp al, bl

jl LABEL_JL

ret

Tasks to do:

1. Write an assembly language program that inputs a single letter and shows the same letter in it's opposite case in a new line. (Lower-case to Upper-case or vice-versa).

Sample Input / Output:

 \mathbf{Z} Input: a Input: Output: A Output: Z

2. Write an assembly language program that inputs a single letter and shows the next 5 (five) letters in opposite case of input (Lower-case to Upper-case or vice-versa) in a row of a new line and also shows the previous 5 (five) letters in the next line in opposite case of input (Lower-case to Upper-case or vice-versa).

Sample Input / Output:

Input: Input: \mathbf{Z} Output: Output: abcde **BCDEF ZYXWV**
